

## **Classification of North Carolina Issued Personal Protective Equipment\***

This document offers a series of strategies or options to optimize supplies of personal protective equipment (PPE) in healthcare settings when there is limited supply. Because of a critical shortage of respiratory protection devices, the Centers for Disease Control and Prevention (CDC), the Food and Drug Administration (FDA), and the Occupational Safety and Health Administration (OSHA) have provided interim guidance to employers on the use of PPE.

PPE shortages are currently posing a tremendous challenge to the US healthcare system because of the COVID-19 pandemic. Healthcare facilities are having difficulty accessing the needed PPE and are having to identify alternate ways to provide patient care. <u>CDC's Strategies for Optimizing</u> <u>PPE</u> offer options for use when PPE supplies are stressed, running low, or absent.

All U.S. healthcare facilities should currently be implementing PPE contingency strategies:

- Maximize use of engineering controls, such as barriers and maintained ventilation systems, and administrative controls, such as altering work practices to minimize patient contacts.
- Cancel elective and non-urgent procedures/appointments.
- Reserve PPE for HCP and replace PPE normally used for source control with other barrier precautions such as tissues.
- Use re-usable PPE that can be reprocessed.
- Use PPE beyond the manufacturer-designated shelf life for training.
- Consider allowing HCP to extend use of respirators, facemasks, and eye protection, beyond a single patient contact.

## Classification System for PPE

The classification system below is to assist in making decisions on sourcing, purchasing, prioritizing, and delivering PPE to both healthcare workers and non-healthcare public service agency workers that have requested protective equipment. The classifications are presented in order of preferred use by level of protection, with Tier I and Tier II PPE being specifically designed for medical use. Tier III and Tier IV PPE are ideal for use by non-healthcare public service workers or healthcare workers when Tier I and Tier II PPE are no longer available.

## Healthcare workers should not use Tier II, III and IV PPE unless Tier I PPE is not available. As PPE becomes available, healthcare facilities should promptly resume standard practices.

Tier I: N-95 Respirators	Tier I: Additional respirators
<ul> <li>All N95 respirators that are approved by the National Institute for Occupational Safety and Health (NIOSH). NIOSH will be somewhere on the respirator.</li> <li>A surgical N95 respirator is a NIOSH-approved N95 respirator that has also been cleared by the FDA as a surgical mask. NIOSH will be somewhere on the respirator.</li> </ul>	• Other NIOSH approved respirators are at least as protective as the N95. These include N99, N100, P95, P99, P100, R95, R99, and R100
Tier I: Surgical and procedural masks	Tier I: Other PPF
<ul> <li>ASTM Level 1, 2, or 3 procedural and surgical masks         <ul> <li>A surgical mask is used inside the operating room and it also protects the healthcare worker from contaminated fluid or debris generated during the procedure.</li> </ul> </li> <li><i>Example of surgical mask</i> is used for performing patient procedures and are used to protect both patients and staff from the transfer of respiratory secretions, fluids or other debris.</li> <li><i>Example of procedural mask</i></li> </ul>	<ul> <li>FDA cleared Medical gloves- Nonsterile or sterile disposable patient examination gloves.</li> <li> <b>Figure 1 Example of medical glove</b> </li> <li> <b>Isolation and surgical gowns</b>- Nonsterile, disposable patient isolation gowns are appropriate when caring for patients with suspected or confirmed COVID-19. </li> <li> <b>Example of isolation gown</b> </li> </ul>

Tier II: Non NIOSH approved/FDA EUA	Tier II: Other PPE
<ul> <li>OSHA, FDA, and the CDC are allowing certain respirators from other countries to be used during COVID-19. They are acceptable in their country.</li> </ul>	Non medical gloves- those used for food service, embalming, cleaning, or other industrial-grade gloves. <i>Example of non-medical glove</i>
Example of KN95	• Coveralls-typically provide 360-degree protection.
Tier III: Utility Mask	Tier III: Other PPE
• Simple physical barrier for exams and visitations or for dry, short procedures that do not produce fluid, spray or aerosols. Also, dust masks that are sold at hardware stores.	• <b>International gowns and coveralls:</b> In times of shortages, healthcare facilities can use international gowns and coveralls that conform to international standards.

Tier IV: Homemade m	asks	Tier IV: Other PPE
<ul> <li>Tier IV: Homemade m</li> <li>For use as a last resort for health providers.</li> <li>Homemade masks are not consision since their capability to protect 1 unknown.</li> <li>Healthcare providers should weawith homemade mask if facility use.</li> </ul>	asks     •       acare     •       dered PPE, HCP is     •       ar face shield is resorting to     •	<ul> <li>Tier IV: Other PPE</li> <li>In a situation of severely limited or no availability, the following PPE can be used: <ul> <li>Disposable laboratory coats</li> <li>Reusable (washable) patient gowns</li> <li>Reusable (washable) laboratory coats</li> <li>Disposable aprons</li> </ul> </li> </ul>

## Important Things to Know about Wearing a Mask:

When you wear your PPE, its surface becomes contaminated by particulate, which may include viruses and bacteria. PPE may also endure wear affecting their integrity due to handling, donning/doffing processes.

Wearers should be careful how they handle PPE after it has been worn and avoid touching the contaminated area. Continued strict adherence to hand hygiene practices, particularly after touching PPE, is critical.
